## QUALITY OF WORK LIFE BETWEEN MEN AND WOMEN POLICE

### CONSTABLES: A META-ANALYSIS

**\*Mallikarjun Biradar**

**Dr.Maheshwari S. Kachapur**

#### **Abstract:**

**Key words:** *Quality of Work, gender-specific, interventions, gender-sensitive and Police.*

*This meta-analysis investigates the Quality of Work Life (QWL) of male and female police constables, focusing on the multidimensional factors affecting their work experience, including organizational support, stress, job satisfaction, and career development. By examining various studies, this analysis highlights both shared and gender-specific challenges that impact QWL. The findings suggest the need for targeted interventions, particularly gender-sensitive policies and leadership approaches, to improve QWL and enhance police performance.*

# QUALITY OF WORK LIFE BETWEEN MEN AND WOMEN POLICE CONSTABLES: A META-ANALYSIS

## Introduction:

Police departments are more diverse today than ever before, as police executives increasingly recognize the benefits of a representative workforce in building public trust and enhancing service delivery (National Research Council, 2004; Williams, 2000). This shift toward inclusivity has brought more women into the policing profession, although disparities in the quality of work life (QWL) persist. Despite persistent underrepresentation in higher ranks and leadership positions, the presence of women in policing has increased significantly in many departments. This growth signifies progress in recruitment policies and public pressure for gender diversity, although structural and cultural barriers still hinder women's full integration and career advancement (Martin, 1990; Schulz, 2003).

The integration of women into police departments, although increasingly widespread, has not occurred without considerable challenges. Female officers often encounter resistance, exclusionary workplace cultures, and gender-based discrimination, all of which can impact their quality of work life (Hassell & Brandl, 2009; National Center for Women and Policing, 2002; Texiera, 2002; Wells & Alt, 2005). These obstacles persist despite formal policies promoting equality, indicating the need for deeper cultural and structural reforms.

An alert, capable, and brave individual with a badge adorning their uniform is a common sight on busy and crowded streets. A closer look at the badge often reveals a proud inscription: *"Protecting the righteous and controlling the wicked."* The police constable, in this context, emerges as the most visible and immediate representative of the government.

In times of need, danger, or crisis, it is often the police constable whom the public turns to for protection and assurance. Their role is not only vital but foundational to maintaining public order and safety in any society. Despite the significance of their duties, police constables frequently work beyond designated hours, endure night shifts, and rarely get holidays. Unfortunately, the harsh realities of their work are not matched by adequate monetary compensation or welfare provisions.

## **Review of Literature:**

Wyatt and Wah (2001) explored managerial executives' perceptions of quality of working life and identified four core dimensions through factor analysis: a favourable work environment, personal growth and autonomy, the nature of the job, and stimulating opportunities and relationships with co-workers. Their findings affirm the multidimensional nature of QWL and support the conceptual understanding that employees evaluate their work life based on both environmental and psychological factors.

Biswas and Gupta (2006) found significant differences between male and female police personnel in their expectations and the perceived availability of QWL attributes in the workplace. Both male and female officers expressed a desire for more meaningful work, a stronger sense of purpose, and organizational policies that enable them to utilize their time effectively on relevant tasks. However, the study also highlighted gender-based differences in how male and female personnel construct their self-image, suggesting that gender influences both the perception of workplace needs and the experience of professional identity.

Indumathy and Kamalraj (2012) identified several key factors that influence and determine the Quality of Work Life. These include an individual's attitude, the work environment, opportunities for advancement, the nature of the job, interpersonal relationships, stress levels, career prospects, the level of challenge, growth and development potential, risk associated with the job, and the reward systems in place. These factors reflect the multidimensional character of QWL, encompassing both personal and organizational elements that shape employee satisfaction and productivity.

Jeyarathnam and Malarvizhi (2011) examined the intensity of working conditions and the behavioural dimensions of employees, concluding that a key strategy for improving Quality of Work Life is to identify and fulfil employees' core needs. The study found that dissatisfaction among workers may arise from multiple factors, including lack of recognition, monotonous and tedious tasks, poor peer relationships, substandard working conditions, low self-esteem, occupational stress, excessive workloads, fatigue, time pressures, job insecurity, and employment instability. These findings underscore the importance of a holistic approach to workplace well-being that considers both environmental and emotional factors.

Tabanejad et al. (2021) argue that the Quality of Work Life (QWL) of police personnel is a contextual, multidimensional concept influenced by various factors such as management and leadership styles, the availability of refreshment and support facilities, and the degree to which officers accept their working conditions. The study emphasizes the crucial role of authorities in enhancing the QWL by fostering an environment that promotes

organizational well-being. This can be achieved by improving working conditions and creating a pleasant and supportive atmosphere, even amidst the inherent difficulties and stressors of police work. These improvements can help police staff feel more positive about their work and organizational affiliation.

Easton et al. (2013) underscore the importance of obtaining a valid assessment of Quality of Work Life (QoWL) in the police service, as it provides a foundation for informed, targeted interventions aimed at enhancing QWL, improving staff performance, and reducing operational costs. The **Work-Related Quality of Life (WRQoL) scale**, an established assessment tool, has shown promise as a reliable and valid measure for evaluating the factors influencing QWL in the police service. Published evaluations of the WRQoL scale indicate that it provides an accurate assessment of key elements such as job satisfaction, stress levels, work-life balance, and organizational support. This tool has the potential to be used in surveys aimed at understanding the work experiences of police personnel, and it can serve as a basis for designing programs to improve overall QWL.

### **Objectives of the Study:**

- To compare QWL between male and female police constables.
- To identify recurring themes, dimensions, and determinants of QWL across studies.
- To highlight gender-specific challenges and expectations.
- To recommend gender-sensitive interventions based on empirical findings.

### **Methodology**

This meta-analysis includes peer-reviewed articles, journals, and empirical studies published between 2000 and 2024 that focus on QWL in policing or related fields. Studies were selected using the keywords: “Quality of Work Life,” “police constables,” “gender differences in policing,” and “workplace stress.” A total of 10 primary studies were selected based on relevance, methodological rigor, and focus on gender comparisons.

## Key Studies Reviewed

| Hassell & Brandl         | 2009 | Race, sex, and workplace experiences     | Women face discrimination and exclusion; QWL impacted by gender-based treatment.                             |

## Key Themes from Studies

- **Organizational Support:** Studies by Zeinab Tabanejad et al. (2021) and Easton et al. (2013) suggest that leadership styles, management support, and workplace conditions significantly impact QWL. Leadership must prioritize a positive organizational atmosphere and provide adequate wellness support for all officers, particularly women.
- **Workplace Stress:** Research by Jeyarathnam & Malarvizhi (2011) and Biswas & Gupta (2006) emphasizes the negative effects of occupational stress on QWL, highlighting gender differences in stress sources and coping mechanisms. Women often face additional stress due to gender discrimination and bias, while men tend to experience stress related to workload and hierarchy pressures.
- **Career Development:** Studies indicate that both male and female constables desire career growth, but women often face greater barriers to advancement. Gender biases in promotion opportunities and leadership roles limit women's ability to progress in their careers, leading to lower QWL compared to their male counterparts.

## Analysis and Synthesis of Findings

### Common QWL Dimensions

Across studies, the following QWL factors were consistently highlighted:

- Physical Work Environment
- Interpersonal Relationships
- Workload and Time Pressure
- Autonomy and Career Growth
- Stress and Fatigue
- Organizational Support
- Recognition and Rewards

### Gender-Based Differences

| Dimension                        | Male Constables                           | Female Constables                                          |
|----------------------------------|-------------------------------------------|------------------------------------------------------------|
| <b>Expectations</b>              | Focus on career stability and recognition | Greater emphasis on meaningful work and supportive culture |
| <b>Work Stress</b>               | Linked to workload and hierarchy pressure | Related to discrimination, work-family conflict            |
| <b>Interpersonal Relations</b>   | Peer cohesion varies                      | Often face exclusion, harassment                           |
| <b>Job Security &amp; Growth</b> | Seek promotions and skill development     | Face glass ceiling and underrepresentation in higher ranks |
| <b>Recognition</b>               | Desire performance-based rewards          | Experience lower recognition for equal or greater effort   |

## 6. Implications for Policy and Practice

- **Gender-Sensitive Leadership and Policies:** Police departments should develop gender-sensitive leadership programs that foster inclusivity and equity. This includes addressing unconscious bias, promoting women in leadership positions, and ensuring that women and men have equal access to career development opportunities.
- **Supportive Work Environments:** Creating a supportive work culture, improving workplace conditions, and offering wellness programs can significantly improve QWL for both genders. The availability of rest areas, psychological support, and stress management resources is critical.

- **Work-Life Balance:** Offering flexible working hours, childcare support, and policies that allow for a better work-life balance can improve the QWL, particularly for female constables, who often juggle work and family responsibilities.
- **Regular Assessments of QWL:** Implementing tools like the **Work-Related Quality of Life scale** (Easton et al., 2013) can help police departments assess QWL periodically and make data-driven decisions for interventions.

## Conclusion

This meta-analysis reveals that while male and female police constables face many of the same challenges in terms of workload, stress, and job satisfaction, women experience unique obstacles related to gender discrimination, career advancement, and work-family balance. Addressing these gender-specific challenges through targeted policies, leadership practices, and organizational reforms is essential to improving QWL for all police personnel.
